Customer Problem Statement

I am a college health and wellness administrator trying to understand and improve the dietary and nutritional habits of students. However, I lack real-time visual insights into students' eating behaviors, health trends, and nutritional deficiencies because the available data is scattered, static, and underutilized for strategic wellness interventions. As a result, I am unable to proactively support and improve student health.

Problem Statements (PS)

PS-1:

I am a student affairs officer who wants to monitor students' nutritional habits to prevent health issues, but I do not have access to interactive tools that provide real-time insights into students' dietary trends.

PS-2:

I am a university nutritionist trying to identify nutritional deficiencies in students' diets, but it is difficult to pinpoint problem areas without an integrated platform that highlights snack overconsumption, vitamin deficiencies, and health perception metrics.

PS-3:

I am a wellness strategist aiming to develop personalized health plans for students, but predictive analytics tools are not available to proactively identify high-risk individuals and recommend tailored interventions.
